

Protect yourself against infectious meningitis

Why is it important to protect yourself?

- Infectious meningitis (meningococcal disease) is a serious disease
- It develops suddenly, and you can become unwell quickly
- Of those who become ill, 1 in 10 will die, and 1 in 3 will suffer permanent health damage

How can you protect yourself?

The most important thing you can do is to get vaccinated. There are two types of vaccines: ACWY vaccine and B vaccine. The meningococcal types that have caused the most disease among adolescents in recent years are well covered by the ACWY vaccine and should be taken by everyone. In 2023, there were also cases of type B disease among adolescents. You need both vaccines to be protected against all meningococcal types.

Symptoms of meningitis

Fever with chills

Aching muscles

Nausea, vomiting and diarrhoea

Sensitivity to bright light

Stiff neck

Headache

Rash with red spots

Taking the vaccine is important, but it does not protect you against all types of meningitis. Early symptoms resemble a hangover or influenza. If you feel very tired and lethargic or have several symptoms, contact a doctor as soon as possible, regardless of whether or not you have been vaccinated. Rapid treatment can save lives.
